1. Task-1

Zettajs

Zetta is an open-source platform for IoT on which we can build APIs for device interaction. The platform is built on Node.js. People who are familiar with Node.js can easily get started with Zetta but, for beginners, a basic understanding of Node.js is required. Zetta is an open source platform, so anyone can use it free of cost. Basically, it's a tool that will help to generate APIs which we can use to communicate between devices. It is an API driven platform and It exposes Websocket endpoints to stream real-time events. It can support almost all device protocols, and mediate them to HTTP. It is possible to create stateless applications in Zetta servers. Applications can be useful to connect devices, run different queries and interact between them. (Maulik Parekh. 2017)

At present, the community is not so big, but it's growing. As it is still in development mode, all the features are not available in Zettajs. Sometimes some bugs appear.

IOT and Zettajs based Greenhouse Environment Monitoring and Controlling Project is a planning project for greenhouse. As it can be run on the cloud, PC or any modest development board, It is much more easier to configuration. This is very easy to code for the IoT project, as user can use JavaScript language. Developers can easily assemble smartphone apps, device apps, and cloud apps. It is developed for data-intensive and real-time applications. Easily can turn any machine into an API. So, we can get temperature, humidity, light measurement and others readings through sensors and the readings can be sent to the cloud by the zettajs platform. The main interesting thing is that we can control or monitor our IoT system of greenhouse through API.
