Python Basics - Assingment 3 ToDo

September 30, 2021

Exercise 1

Task 1 Define a function called **repeat_stuff** that takes in two inputs, **stuff**, and **num_repeats**.

We will want to make this function print a string with stuff repeated num_repeats amount of times. For now, only put an empty print statement inside the function.

[1]:
```
def repeat_stuff(stuff,num_repeats):
    print()
```

0.0.1 Example solutions task 1.

CLICK ME

```
def repeat_stuff(stuff, num_repeats):
  print()
```

Task 2 Outside of the function, call repeat_stuff.

You can use the value "Row" for stuff and 3 for num_repeats. Change the print statement inside repeat_stuff to a **return** statement instead. It should **return stuff*num_repeats** Note: Multiplying a string just makes a new string with the old one repeated! For example: "na*6 -> result is nanananana Then, give the parameter **num_repeats** a default value of **10**.

[6]:
```
def repeat_stuff(stuff, num_repeats=10):
  return stuff*num_repeats
repeat_stuff("Row ", 3)
```

[6]:
```
'Row Row Row '
```

0.0.2 Example solutions task 2.

CLICK ME

```
def repeat_stuff(stuff, num_repeats=10):
  return stuff*num_repeats

repeat_stuff("Row ", 3)
```

Task 3 Add **repeat_stuff("Row", 3)** and the string **"Your Boat."** together and save the result to a variable called **lyrics**.

Create a variable called **song** and assign it the value of **repeat_stuff** called with the singular input **lyrics**.

Print song.

Good job!!

[7]:
```
def repeat_stuff(stuff, num_repeats=10):
  return stuff*num_repeats

lyrics = repeat_stuff("Row ", 3) + "Your Boat. "
song = repeat_stuff(lyrics)

print(song)
```

```
Row Row Row Your Boat. Row Row Row Your Boat. Row Row Row Your Boat. Row Row Row
Your Boat. Row Row Row Your Boat. Row Row Row Your Boat. Row Row Row Your Boat.
Row Row Row Your Boat. Row Row Row Your Boat. Row Row Row Your Boat.
```

0.0.3 Example solutions task 3.

CLICK ME

```
def repeat_stuff(stuff, num_repeats=10):
  return stuff*num_repeats

lyrics = repeat_stuff("Row ", 3) + "Your Boat. "
song = repeat_stuff(lyrics)

print(song)
```

Exercise 2

The program reads the height in centimeters and then converts the height to feet and inches.

Problem Solution

1. Take the height in centimeters and store it in a variable.
2. Convert the height in centimeters into inches and feet.
3. Print the length in inches and feet.
4. Exit.

Hint! inches=0.394*cm* *feet=0.0328*cm

[9]:
```
cm=int(input("Enter the height in centimeters:"))
inches=0.394*cm
feet=0.0328*cm
print("The length in inches",round(inches,3))
```

```
print("The length in feet",round(feet,2))
```

```
Enter the height in centimeters: 132

The length in inches 52.008
The length in feet 4.33
```

0.0.4 Example solutions task Exercise 2.

CLICK ME

```
cm=int(input("Enter the height in centimeters:"))
inches=0.394*cm
feet=0.0328*cm
print("The length in inches",round(inches,2))
print("The length in feet",round(feet,2))
```

Exercise 3

This is a Python Program to check whether a number is positive or negative.

Problem Solution

1. Take the value of the integer and store in a variable.
2. Use an if statement to determine whether the number is positive or negative.
3. Exit.

[10]:
```
n=int(input("Enter number: "))
if(n>0):
    print("Number is positive")
else:
    print("Number is negative")
```

```
Enter number:  -4

Number is negative
```

0.0.5 Example solutions task Exercise 3.

CLICK ME

```
n=int(input("Enter number: "))
if(n>0):
    print("Number is positive")
else:
    print("Number is negative")
```
