Python Basics - Assingment 4

September 30, 2021

1 Python Basics - Assingment 4

Task 1: Create a string (name), an integer (num) and a floating point number (fnum). Assign your name to name, 25 to num and 56.78 to fnum. Print the output for all 3 variables.

[1]:
```
#name
#num
#fnum
#print name
#print num
#print fnum

name = "Faruk"
num = 25
fnum = 56.78
print (name)
print (num)
print (fnum)
```

```
Faruk
25
56.78
```

Task 2: Use the capitalize() method to convert the first character of a string to uppercase letter.

[4]:
```
mystring = "this is getting interesting."
mycaptial_string = mystring.capitalize() #use capitalize method
#print the capitalized string
print (mycaptial_string)
```

```
This is getting interesting.
```

Task 3: The find() method returns the index of first occurence of the substring if it is found and if it does not find it returns -1. Use find() method to complete the code below.

[6]:
```
text = "Python is an easy to learn language"
result = text.find('learn')#find learn
#print result
```

```
print(result)
```

```
21
```

Task 4: It is possible to assign the same value to multiple variables at once in Python. Complete the code below.

[9]:
```
# create 3 variables a,b & c &
# assign 1 as value to all variables in the same statement
# incorrect answer if it a=1 b=1 c=1
a = b = c = 1
print (a)
print (b)
print (c)
#print a
#print b
#print c
```

```
1
1
1
```

Task 5: Complete tasks as in the comment below

[12]:
```
a = "I like python"
print(len(a)) # use the len method to print the length of the string
print(a[0]) # print the first character of the string
print(a.upper()) # print the string in uppercase letters
newtext = ("1 Niin metsä vastaa, kuin sinne huudetaan")
# it should print 1 Niin metsä vastaa, kuin sinne huudetaan
print(newtext) # print the newtext
```

```
13
I
I LIKE PYTHON
1 Niin metsä vastaa, kuin sinne huudetaan
```

Task 6: Create a list named mylist and include 5 different data items. (4 points)

[15]:
```
mylist = ["abc", 34, True, 20.5, 1j] # it should contain 5 different data items
print(mylist) # print the entire list
print(mylist[1]) # print only the second element
#use append to add one more item to your list
mylist.append(False)
print(mylist) #print the entire list
```

```
['abc', 34, True, 20.5, 1j]
34
['abc', 34, True, 20.5, 1j, False]
```

Task 7: Tuple (3 points)

[17]:
```
courses = ("Introduction to IoT & Cloud", "Python Basics for IoT", "Python␣
 ↪Project")
print(len(courses)) #use len method to print the number of items(courses) in␣
 ↪the tuple courses.
print(courses) #print all items in the tuple courses
print(courses[-1]) #print the third item in the tuple
```

```
3
('Introduction to IoT & Cloud', 'Python Basics for IoT', 'Python Project')
Python Project
```

Task 8: Dictionary (5 points)

[23]:
```
#create a dictionary with the key as course, time and ects
    #values as Python Basics, Autumn, 5
test = {
    'course': 'python basic',
    'time': 'Autumn',
    'ects': '5'
}
print(test.get('course')) #use get method to print the value of the course
test['course'] = 'Python Basics for IoT' #change the course value to Python␣
 ↪Basics for IoT

test['year'] = 2020 #add the key/value pair as year:2020 to the test dictionary
print(test) #print the entire dictionary
#use pop method to remove time form the dictionary
```

```
python basic
{'course': 'Python Basics for IoT', 'time': 'Autumn', 'ects': '5', 'year': 2020}
```

[ ]:
```

```
